

CIS 700: “algorithms for Big Data”

Lecture 5: Dimension Reduction

Slides at <http://grigory.us/big-data-class.html>

Grigory Yaroslavtsev

<http://grigory.us>

Today

- Dimensionality reduction
 - AMS as dimensionality reduction
 - Johnson-Lindenstrauss transform

L_p -norm Estimation

- Stream: \mathbf{m} updates $(x_i, \Delta_i) \in [n] \times \mathbb{R}$ that define vector f where $f_j = \sum_{i:x_i=j} \Delta_i$.
- Example: For $n = 4$

$$\langle (1,3), (3,0.5), (1,2), (2,-2), (2,1), (1,-1), (4,1) \rangle$$
$$f = (4, -1, 0.5, 1)$$

- L_p -norm: $\|f\|_p = (\sum_i |f_i|^p)^{\frac{1}{p}}$

L_p -norm Estimation

- L_p -norm: $\|f\|_p = (\sum_i |f|^p)^{\frac{1}{p}}$
- Two lectures ago:
 - $\|f\|_0$ = F_0 -moment
 - $\|f\|_2^2$ = F_2 -moment (via AMS sketching)
- Space: $O\left(\frac{\log n}{\epsilon^2} \log \frac{1}{\delta}\right)$
- Technique: linear sketches
 - $\|f\|_0$: $\sum_{i \in S} f_i$ for random sets S
 - $\|f\|_2^2$: $\sum_i \sigma_i f_i$ for random signs σ_i

AMS as dimensionality reduction

- Maintain a “linear sketch” vector

$$\mathbf{Z} = (Z_1, \dots, Z_k) = Rf$$

$$Z_i = \sum_{j \in [n]} \sigma_{ij} f_j, \text{ where } \sigma_{ij} \in_R \{-1, 1\}$$

- Estimator Y for $\|f\|_2^2$:

$$\frac{1}{k} \sum_{i=1}^k Z_i^2 = \frac{\|Rf\|_2^2}{k}$$

- “Dimensionality reduction”: $x \rightarrow Rx$, “heavy” tail

$$\Pr \left[\left| Y - \|f\|_2^2 \right| \geq c \left(\frac{2}{k} \right)^{\frac{1}{2}} \|f\|_2^2 \right] \leq \frac{1}{c^2}$$

Normal Distribution

- Normal distribution $N(0,1)$
 - Range: $(-\infty, +\infty)$
 - Density: $\mu(x) = (2\pi)^{-\frac{1}{2}} e^{-\frac{x^2}{2}}$
 - Mean = 0, Variance = 1
- Basic facts:
 - If X and Y are independent r.v. with normal distribution then $X + Y$ has normal distribution
 - $Var[cX] = c^2 Var[X]$
 - If X, Y are independent, then $Var[X + Y] = Var[X] + Var[Y]$

Johnson-Lindenstrauss Transform

- Instead of ± 1 let σ_i be i.i.d. random variables from normal distribution $N(0,1)$

$$Z = \sum_i \sigma_i f_i$$

- We still have $\mathbb{E}[Z^2] = \sum_i f_i^2 = \|f\|_2^2$ because:
 - $\mathbb{E}[\sigma_i]\mathbb{E}[\sigma_j] = 0$; $\mathbb{E}[\sigma_i^2] = \text{"variance of } \sigma_i \text{"} = 1$
- Define $\mathbf{Z} = (Z_1, \dots, Z_k)$ and define:

$$\|\mathbf{Z}\|_2^2 = \sum_j Z_j^2 \quad (\mathbb{E}[\|\mathbf{Z}\|_2^2] = k\|f\|_2^2)$$

- JL Lemma: There exists $C > 0$ s.t. for small enough $\epsilon > 0$:
$$\Pr\left[\left|\|\mathbf{Z}\|_2^2 - k\|f\|_2^2\right| > \epsilon k\|f\|_2^2\right] \leq \exp(-C\epsilon^2 k)$$

Proof of JL Lemma

- JL Lemma: $\exists C > 0$ s.t. for small enough $\epsilon > 0$:

$$\Pr \left[\left| \left\| \mathbf{Z} \right\|_2^2 - k \left\| f \right\|_2^2 \right| > \epsilon k \left\| f \right\|_2^2 \right] \leq \exp(-C\epsilon^2 k)$$

- Assume $\left\| f \right\|_2^2 = 1$.
- We have $\mathbf{Z}_i = \sum_j \sigma_{ij} f_i$ and $\mathbf{Z} = (\mathbf{Z}_1, \dots, \mathbf{Z}_k)$

$$\mathbb{E} \left[\left\| \mathbf{Z} \right\|_2^2 \right] = k \left\| f \right\|_2^2 = k$$

- Alternative form of JL Lemma:

$$\Pr \left[\left\| \mathbf{Z} \right\|_2^2 > k(1 + \epsilon)^2 \right] \leq \exp(-\epsilon^2 k + O(k \epsilon^3))$$

Proof of JL Lemma

- Alternative form of JL Lemma:

$$\Pr \left[\left| \left| \mathbf{Z} \right| \right|_2^2 > k(1 + \epsilon)^2 \right] \leq \exp(-\epsilon^2 k + O(k \epsilon^3))$$

- Let $Y = \left| \left| \mathbf{Z} \right| \right|_2^2$ and $\alpha = k(1 + \epsilon)^2$

- For every $s > 0$ we have:

$$\Pr[Y > \alpha] = \Pr[e^{sY} > e^{s\alpha}]$$

- By Markov and independence of \mathbf{Z}'_i s:

$$\Pr[e^{sY} > e^{s\alpha}] \leq \frac{\mathbb{E}[e^{sY}]}{e^{s\alpha}} = e^{-s\alpha} \mathbb{E}\left[e^{s \sum_i \mathbf{Z}_i^2}\right] = e^{-s\alpha} \prod_{i=1}^k \mathbb{E}\left[e^{s \mathbf{Z}_i^2}\right]$$

- We have $Z_i \in N(0,1)$, hence:

$$\mathbb{E}\left[e^{s \mathbf{Z}_i^2}\right] = (2\pi)^{-\frac{1}{2}} \int_{-\infty}^{\infty} e^{st^2} e^{-\frac{t^2}{2}} dt = \frac{1}{\sqrt{1 - 2s}}$$

Proof of JL Lemma

- Alternative form of JL Lemma:

$$\Pr \left[\left| \|Z\|_2^2 - k(1 + \epsilon)^2 \right] \leq \exp(-\epsilon^2 k + O(k \epsilon^3)) \right.$$

- For every $s > 0$ we have:

$$\Pr[Y > \alpha] \leq e^{-s\alpha} \prod_{i=1}^k \mathbb{E} \left[e^{sZ_i^2} \right] = e^{-s\alpha} (1 - 2s)^{-\frac{k}{2}}$$

- Let $s = \frac{1}{2} \left(1 - \frac{k}{\alpha} \right)$ and recall that $\alpha = k(1 + \epsilon)^2$
- A calculation finishes the proof:

$$\Pr[Y > \alpha] \leq \exp(-\epsilon^2 k + O(k \epsilon^3))$$

Johnson-Lindenstrauss Transform

- Single vector: $k = O\left(\frac{\log \frac{1}{\delta}}{\epsilon^2}\right)$
 - Tight: $k = \Omega\left(\frac{\log \frac{1}{\delta}}{\epsilon^2}\right)$ [Woodruff'10]
- n vectors simultaneously: $k = O\left(\frac{\log n \log \frac{1}{\delta}}{\epsilon^2}\right)$
 - Tight: $k = \Omega\left(\frac{\log n \log \frac{1}{\delta}}{\epsilon^2}\right)$ [Molinaro, Woodruff, Y. '13]
- Distances between n vectors = $O(n^2)$ vectors:
$$k = O\left(\frac{\log n \log \frac{1}{\delta}}{\epsilon^2}\right)$$

Random Variables and Norms

- For a random variable X and $p \geq 1$ let:

$$\|X\|_p = \mathbb{E}[X^p]^{1/p}$$

Facts:

- For any c : $\|cX\|_p = c\|X\|_p$
- $\|\cdot\|_p$ is a norm (Minkowski's inequality)
- $\|\cdot\|_p \leq \|\cdot\|_q$ for $p \leq q$ (Monotonicity of norms)
- Jensen's inequality (used a lot for $F = |x|^p$):
If F is convex then $F(\mathbb{E}[X]) \leq \mathbb{E}[F(X)]$

Khintchine Inequality

- [Khintchine] For $p \geq 1$, $x \in \mathbb{R}^n$ and σ_i i.i.d. Rademachers:

$$\left\| \sum_i \sigma_i x_i \right\|_p \leq \sqrt{p} \left\| x \right\|_2$$

- For r_i (either σ_i or $g_i \sim N(0,1)$) expand $\mathbb{E}[(\sum_i r_i x_i)^p]$
- All odd powers of r_i are zero
- All even moments for σ_i are 1, and for g_i are ≥ 1
- $\left\| \sum_i \sigma_i x_i \right\|_p \leq \left\| \sum_i g_i x_i \right\|_p$
- $\sum_i g_i x_i \sim N\left(0, \left\| x \right\|_2^2\right) \Rightarrow \left\| \sum_i g_i x_i \right\|_p \leq \sqrt{p} \left\| x \right\|_2$

Symmetrization

- [Symmetrization]: If Z_1, \dots, Z_n are independent and σ_i are i.i.d. Rademachers:

$$\left\| \sum_i Z_i - \mathbb{E} \sum_i Z_i \right\|_p \leq 2 \left\| \sum_i \sigma_i Z_i \right\|_p$$

- Let $Y_1 \dots Y_n$ be independent with the same distribution as Z_i
- $\left\| \sum_i Z_i - \mathbb{E} \sum_i Z_i \right\|_p = \left\| \sum_i Z_i - \mathbb{E}_Y \sum_i Y_i \right\|_p$
 $\leq \left\| \sum_i (Z_i - Y_i) \right\|_p$ (Jensen)
 $= \left\| \sum_i \sigma_i (Z_i - Y_i) \right\|_p$ ($Z_i - Y_i$ are independent and symmetric)
 $\leq 2 \left\| \sum_i \sigma_i Z_i \right\|_p$ (triangle inequality)

Decoupling

- Let x_1, \dots, x_n be independent with mean 0 and x'_1, \dots, x'_n identically distributed as x_i and independent of them. For any a_{ij} and $p \geq 1$:

$$\left\| \sum_{i \neq j} a_{ij} x_i x_j \right\|_p \leq 4 \left\| \sum_{i,j} a_{ij} x_i x'_j \right\|_p$$

- Let η_1, \dots, η_n be i.i.d. Bernoullis (0/1 w.p. 1/2):

$$\begin{aligned} \left\| \sum_{i \neq j} a_{ij} x_i x_j \right\|_p &= 4 \left\| \mathbb{E}_\eta \sum_{i \neq j} a_{ij} x_i x_j \eta_i (1 - \eta_j) \right\|_p \\ &\leq 4 \left\| \sum_{i \neq j} a_{ij} x_i x_j \eta_i (1 - \eta_j) \right\|_p \text{ (Jensen)} \end{aligned}$$

- There exists $\eta' \in \{0,1\}^n$ such that:

$$\left\| \sum_{i \neq j} a_{ij} x_i x_j \eta_i (1 - \eta_j) \right\|_p \leq \left\| \sum_{i \in S} \sum_{j \in \bar{S}} a_{ij} x_i x_j \right\|_p$$

where $S = \{i : \eta' = 1\}$.

Decoupling (continued)

Let x_S be an S -dimensional vector of x_i for $i \in S$.

- $\left\| \sum_{i \in S} \sum_{j \in \bar{S}} a_{ij} x_i x_j \right\|_p = \left\| \sum_{i \in S} \sum_{j \in \bar{S}} a_{ij} x_i x'_j \right\|_p$
 $= \left\| \mathbb{E}_{x_{\bar{S}}} \mathbb{E}_{x'_{\bar{S}}} \sum_{i,j} a_{ij} x_i x'_j \right\|_p \quad (\mathbb{E}[x_i] = \mathbb{E}[x'_i] = 0)$
 $\leq \left\| \sum_{i,j} a_{ij} x_i x'_j \right\|_p \text{ (Jensen)}$
- Overall:

$$\left\| \sum_{i \neq j} a_{ij} x_i x_j \right\|_p \leq 4 \left\| \sum_{i,j} a_{ij} x_i x'_j \right\|_p$$

Hanson-Wright Inequality

- For $\sigma_1, \dots, \sigma_n$ independent Rademachers and $A \in \mathbb{R}^{n \times n}$ real and symmetric for all $p \geq 1$:
$$\left| \left| \sigma^T A \sigma - \mathbb{E}[\sigma^T A \sigma] \right| \right|_p \leq \sqrt{p} \left| \left| A \right| \right|_F + p \left| \left| A \right| \right|$$
- Recall:

$$- \left| \left| A \right| \right|_F = \sqrt{\sum_{ij} a_{ij}^2} = \sqrt{\text{Tr}(A^T A)}$$

$$- \left| \left| A \right| \right| = \sup_{\{\nu \neq 0\}} \frac{\left| \left| A \nu \right| \right|_2}{\left| \left| \nu \right| \right|_2}$$

Hanson-Wright Inequality

- For $\sigma_1, \dots, \sigma_n$ independent Rademachers and $A \in \mathbb{R}^{n \times n}$ real and symmetric for all $p \geq 1$:

$$\left\| \sigma^T A \sigma - \mathbb{E}[\sigma^T A \sigma] \right\|_p \leq \sqrt{p} \left\| A \right\|_F + p \left\| A \right\|$$

$$\left\| \sigma^T A \sigma - \mathbb{E}[\sigma^T A \sigma] \right\|_p \leq \left\| \sigma^T A \sigma' \right\|_p \text{ (decoupling)}$$

$$\leq \sqrt{p} \left\| \left\| A \sigma \right\|_2 \right\|_p \text{ (Khintchine)}$$

$$= \sqrt{p} \left\| \left\| A \sigma \right\|_2^2 \right\|_{p/2}^{\frac{1}{2}}$$

$$\leq \sqrt{p} \left\| \left\| A \sigma \right\|_2^2 \right\|_p^{\frac{1}{2}} \text{ (monotonicity of norms)}$$

Hanson-Wright (continued)

$$\begin{aligned} & \sqrt{p} \left\| \left\| |A\sigma| \right\|_2 \right\|_p \leq \dots \leq \sqrt{p} \left\| \left\| |A\sigma| \right\|_2^2 \right\|_p^{\frac{1}{2}} \\ & \leq \sqrt{p} \left(\mathbb{E} \left[\left\| |A\sigma| \right\|_2^2 \right] + \left\| \left\| |A\sigma| \right\|_2^2 - \mathbb{E} \left[\left\| |A\sigma| \right\|_2^2 \right] \right\|_p \right)^{\frac{1}{2}} \text{ (triangle ineq.)} \\ & = \sqrt{p} \left(\left\| |A| \right\|_F^2 + \left\| \left\| |A\sigma| \right\|_2^2 - \mathbb{E} \left[\left\| |A\sigma| \right\|_2^2 \right] \right\|_p \right)^{\frac{1}{2}} \\ & \leq \sqrt{p} \left\| |A| \right\|_F + \sqrt{p} \left\| \left\| |A\sigma| \right\|_2^2 - \mathbb{E} \left[\left\| |A\sigma| \right\|_2^2 \right] \right\|_p^{\frac{1}{2}} \\ & \preccurlyeq \sqrt{p} \left\| |A| \right\|_F + \sqrt{p} \left\| |\sigma^T A^T A \sigma'| \right\|_p^{\frac{1}{2}} \text{ (decoupling)} \\ & \preccurlyeq \sqrt{p} \left\| |A| \right\|_F + p^{\frac{3}{4}} \left\| |A^T A \sigma| \right\|_2^{1/2} \text{ (Khintchine)} \\ & \preccurlyeq \sqrt{p} \left\| |A| \right\|_F + p^{\frac{3}{4}} \left\| |A| \right\|^{1/2} \left\| \left\| |Ax| \right\|_2 \right\|_p^{\frac{1}{2}} \end{aligned}$$

Hanson-Wright (continued)

$$\sqrt{p} \left\| \left\| |A\sigma| \right\|_2 \right\|_p \leq \sqrt{p} \|A\|_F + p^{\frac{3}{4}} \|A\|^{\frac{1}{2}} \left\| \left\| |A\sigma| \right\|_2 \right\|_p^{\frac{1}{2}}$$

Let $E = \left\| \left\| Ax \right\|_2 \right\|_p^{\frac{1}{2}}$ then $E^2 - Cp^{\frac{1}{4}} \|A\|^{\frac{1}{2}} E - C \|A\|_F \leq 0$

- $E \leq$ larger root of the quadratic equation above
- $E^2 \leq \sqrt{p} \|A\|_F + p \|A\|$
- (Hanson-Wright) For $\sigma_1, \dots, \sigma_n$ independent Rademachers and $A \in \mathbb{R}^{n \times n}$ real and symmetric for all $p \geq 1$:

$$\|\sigma^T A \sigma - \mathbb{E}[\sigma^T A \sigma]\|_p \leq \sqrt{p} \|A\|_F + p \|A\|$$

Recap

- For a random variable X and $p \geq 1$ let:

$$\|X\|_p = \mathbb{E}[X^p]^{1/p}$$

- [Khintchine] For $p \geq 1$, $x \in \mathbb{R}^n$ and σ_i i.i.d. Rademachers:

$$\left\| \sum_i \sigma_i x_i \right\|_p \leq \sqrt{p} \|x\|_2$$

- [Symmetrization]: If Z_1, \dots, Z_n are independent and σ_i are i.i.d. Rademachers:

$$\left\| \sum_i Z_i - \mathbb{E} \sum_i Z_i \right\|_p \leq 2 \left\| \sum_i \sigma_i Z_i \right\|_p$$

- [Hanson-Wright] For $\sigma_1, \dots, \sigma_n$ independent Rademachers and $A \in \mathbb{R}^{n \times n}$ real and symmetric for all $p \geq 1$:

$$\left\| \sigma^T A \sigma - \mathbb{E}[\sigma^T A \sigma] \right\|_p \leq \sqrt{p} \|A\|_F + p \|A\|$$

Bernstein Inequality

- Let X_1, \dots, X_n be indep. r.v's such that $|X_i| \leq K$ almost surely and $\mathbb{E}[\sum_i X_i^2] \leq \sigma^2$. For all $p \geq 1$:

$$\left\| \sum_i X_i - \mathbb{E}[X_i] \right\|_p \leq \sigma\sqrt{p} + Kp$$

$$\left\| \sum_i X_i - \mathbb{E}[X_i] \right\|_p \leq 2 \left\| \sum_i \sigma_i X_i \right\|_p \text{ (symmetrization)}$$

$$\leq \sqrt{p} \left\| (\sum_i X_i^2)^{\frac{1}{2}} \right\|_p \text{ (Khintchine)}$$

$$= \sqrt{p} \left\| \sum_i X_i^2 \right\|_p^{\frac{1}{2}}$$

$$\leq \sigma\sqrt{p} + \sqrt{p} \left\| \sum_i X_i^2 - \mathbb{E}[X_i^2] \right\|_p^{1/2} \text{ (triangle inequality)}$$

Bernstein Inequality (cont.)

$$\left\| \sum_i X_i - \mathbb{E}[X_i] \right\|_p \leq \dots \leq \sqrt{p} \left\| (\sum_i X_i^2)^{\frac{1}{2}} \right\|_p$$

$$\leq \sigma\sqrt{p} + \sqrt{p} \left\| \sum_i X_i^2 - \mathbb{E}[X_i^2] \right\|_p^{\frac{1}{2}}$$

$$\leq \sigma\sqrt{p} + \sqrt{p} \left\| \sum_i \sigma_i X_i^2 \right\|_p^{\frac{1}{2}} \text{ (symmetrization)}$$

$$\leq \sigma\sqrt{p} + p^{\frac{3}{4}} \left\| \sum_i (X_i^4)^{1/2} \right\|_p^{\frac{1}{2}} \text{ (Khintchine)}$$

$$\leq \sigma\sqrt{p} + p^{\frac{3}{4}} \sqrt{K} \left\| \sum_i (X_i^2)^{1/2} \right\|_p^{\frac{1}{2}}$$

Bernstein Inequality (cont.)

- Let $E = \|(\sum_i X_i^2)^{\frac{1}{2}}\|_p$ then for some $C > 0$:
$$E^2 - Cp^{\frac{1}{4}}\sqrt{KE} - C\sigma \leq 0$$
- $E \geq$ larger root of this quadratic equation
- $E \leq \sigma\sqrt{p} + Kp$
- [Bernstein] Let X_1, \dots, X_n be indep. r.v's such that $|X_i| \leq K$ almost surely and $\mathbb{E}[\sum_i X_i^2] \leq \sigma^2$. For all $p \geq 1$:

$$\left\| \sum_i X_i - \mathbb{E}[X_i] \right\|_p \leq \sigma\sqrt{p} + Kp$$

Sparse Johnson-Lindenstrauss Transform

- Let $\Pi \in \mathbb{R}^{m \times n}$ be a JL-matrix where $m = O\left(\frac{1}{\epsilon^2} \log \frac{1}{\delta}\right)$ which satisfies for $\|x\|_2 = 1$:
$$\Pr_{\Pi} \left[\left| \left\| \Pi x \right\|_2^2 - 1 \right| \geq \epsilon \right] \leq \delta$$
- Takes $O\left(m \|x\|_0\right)$ time to compute JL
- Would be $O\left(s \|x\|_0\right)$ time if Π only had s non-zero entries per column

Basic Sparse JL Transform

- Pick 2-wise indep. hash function $h : [n] \rightarrow [m]$
- Pick 4-wise indep. hash function $\sigma : [n] \rightarrow \{-1,1\}$
- For each $i \in [n]$ let $\Pi_{h(i),i} = \sigma(i)$, the rest are 0
- [Thorup, Zhang'12]: This is JL if $m \geq \frac{1}{\epsilon^2 \delta}$
- Best possible since $s = 1$
- Analysis: standard expectation/variance using bounded independence + Chebyshev
- To improve m let's use Hanson-Wright (higher moment than Chebyshev's second)

Sparse JL Transform: Construction

- $\Pi_{r,i} = \eta_{r,i} \sigma_{r,i} / \sqrt{s}$, where η_i are Bernoullis and σ_i are Rademachers
- For all r, i : $\mathbb{E}[\eta_{r,i}] = \frac{s}{m}$
- For all i : $\sum_r \eta_{r,i} = s$ (s non-zeros per column)
- $\eta_{r,i}$ are negatively correlated:

$$\mathbb{E} \left[\prod_{(r,i) \in S} \eta_{r,i} \right] \leq \prod_{(r,i) \in S} \mathbb{E}[\eta_{r,i}] = \left(\frac{s}{m}\right)^{|S|}$$

- Each column chosen uniformly from $\text{Binom}(m, s)$ columns of weight s works here

Sparse JL Transform: Analysis

Thm [KN'14]: If $m = O\left(\frac{1}{\epsilon^2} \log \frac{1}{\delta}\right)$ and $s \approx \epsilon m$:

$$\forall x: \left\| x \right\|_2 = 1, \Pr_{\Pi} \left[\left| \left\| \Pi x \right\|_2^2 - 1 \right| \geq \epsilon \right] \leq \delta$$

- $Z = \left\| \Pi x \right\|_2^2 - 1 = \frac{1}{s} \sum_{r=1}^m \sum_{i \neq j} \eta_{r,i} \eta_{r,j} \sigma_{r,i} \sigma_{r,j} x_i x_j \equiv \sigma^T A_{x,\eta} \sigma$
- $A_{x,\eta}$ is a block-diagonal matrix with m blocks where r -th block is $\frac{1}{s} x^{(r)} (x^{(r)})^T$ but with zeros on the diagonal
- $x^{(r)}$ is a vector with entries $x_i^{(r)} = \eta_{r,i} x_i$
- By Hanson-Wright: $\left\| Z \right\|_p \leq \left\| \sqrt{p} \left\| A_{x,\eta} \right\|_F + p \left\| A_{x,\eta} \right\| \right\|_p$
 $\leq \sqrt{p} \left\| \left\| A_{x,\eta} \right\|_F \right\|_p + p \left\| \left\| A_{x,\eta} \right\| \right\|_p$

Sparse JL Transform: Analysis

- (Operator norm) Since $A_{x,\eta}$ is block-diagonal $\|A_{x,\eta}\|$ is the largest norm of any block
- Eigenvalues in the r -th block are at most

$$\frac{2}{s} \max \left(\left\| x^{(r)} \right\|_2^2, \left\| x^{(r)} \right\|_\infty^2 \right) \leq \frac{2}{s}$$

- $\|A_{x,\eta}\| \leq \frac{2}{s}$

Sparse JL Transform: Analysis

- Define $Q_{i,j} = \sum_{r=1}^m \eta_{r,i} \eta_{r,j}$ so that:

$$\left\| A_{x,\eta} \right\|_F^2 = 1/s^2 \sum_{i \neq j} x_i^2 x_j^2 Q_{i,j}$$

- **Lemma:** If $p \approx s^2/m$ then $\forall i, j \left\| Q_{i,j} \right\|_p \leq p$

$$\begin{aligned} & \left\| \left\| A_{x,\eta} \right\|_F \right\|_p = \left\| \left\| A_{x,\eta} \right\|_F^2 \right\|^{\frac{1}{2}} p \\ & \leq \left\| \left\| \frac{1}{s^2} \sum_{i \neq j} x_i^2 x_j^2 Q_{i,j} \right\|_F^2 \right\|^{\frac{1}{2}} p \\ & \leq \frac{1}{s} \left(\sum_{i \neq j} x_i^2 x_j^2 \left\| Q_{i,j} \right\|_p \right)^{1/2} \text{(triangle ineq.)} \\ & \leq 1/\sqrt{m} \end{aligned}$$

Sparse JL Transform: Analysis

- By Markov ($m = O\left(\frac{1}{\epsilon^2} \log 1/\delta\right)$, $s \approx \epsilon m$, $p \approx \frac{s^2}{m}$):

$$\Pr\left[\left|\left|\Pi x\right|\right|_2^2 - 1 > \epsilon\right] =$$

$$\Pr\left[\left|\sigma^T A_{x,\eta} \sigma\right|^p > \epsilon^p\right] \leq$$

$$\epsilon^{-p} \mathbb{E}\left[\left|\sigma^T A_{x,\eta} \sigma\right|^p\right] \text{ (Markov)}$$

$$\leq \epsilon^{-p} C^p \left(\frac{\sqrt{p}}{\sqrt{m}} + \frac{p}{s}\right)^p = \epsilon^{-p} C^p (\epsilon + \epsilon)^p \leq \delta$$

Sparse JL Transform: Analysis

- **Lemma:** If $p \approx s^2/m$ then $\forall i, j \left\| Q_{i,j} \right\|_p \leq p$
- Suppose $\eta_{a_1,i}, \dots, \eta_{a_s,i}$ are all 1 where $a_1 < \dots < a_s$.
- Note that $Q_{ij} = \sum_{t=1}^s Y_t$ where t is an indicator r.v. for the event $\eta_{a_t,j} = 1$.
- Y_t 's are not indep. but negatively correlated \Rightarrow p-th moment at most p-th moments of i.i.d. Bernoullis with expectation $\frac{s}{m}$ (expand $(\sum_t Y_t)^p$ and compare term by term)
- By Bernstein inequality:

$$\left\| Q_{ij} \right\|_p = \left\| \sum_t Y_t \right\| \leq \sqrt{\frac{s^2}{m}} \sqrt{p} + p \approx p$$

FFT-based Fast JL-Transform

- [Ailon, Chazelle'09] Running time $O(n \log n)$
- Define $\Pi \in \mathbb{R}^{m \times n}$ as $\Pi = \frac{1}{\sqrt{m}} S H D$
- $S = m \times n$ sampling matrix (with replacement)
- $H =$ unnormalized bounded orthonormal system,
i.e. $H \in \mathbb{R}^{n \times n}; H^T H = I; \max_{i,j} |H_{i,j}| \leq 1$
- $D = \text{diag}(\alpha)$ for $(\alpha_1, \dots, \alpha_n)$ i.i.d. Rademachers
- If $H =$ Hadamard matrix $\Rightarrow O(n \log n)$ time to
compute Πx

FFT-based Fast JL-Transform

- Change S to $S_\eta = \text{diag}(\eta_1, \dots, \eta_n)$ where η_i are Bernoullis with expectation $\mathbb{E}[\eta_i] = m/n$
- [CNW'15] If $\Pi = \frac{1}{\sqrt{m}} S_\eta H D$, $m \geq \epsilon^{-2} \log \frac{1}{\delta} \log \frac{1}{\epsilon \delta}$:
$$\forall x: \left| \left| x \right| \right|_2 = 1, \Pr_{\Pi} \left[\left| \left| \Pi x \right| \right|_2^2 - 1 \geq \epsilon \right] \leq \delta$$
- Let $z = HDx$ so $\left| \left| \Pi x \right| \right|_2^2 = \frac{1}{m} \sum_i \eta_i z_i^2$
- Will show that $\left\| \frac{1}{m} \sum_{i=1}^n \eta_i z_i^2 - 1 \right\|_p$ is small

FFT-based Fast JL-Transform

$$\begin{aligned} & \left\| \frac{1}{m} \sum_{i=1}^n \eta_i z_i^2 - 1 \right\|_p \leq \frac{2}{m} \left\| \sum_i \sigma_i \eta_i z_i^2 \right\|_p \text{ (symmetrization)} \\ & \leq \frac{\sqrt{p}}{m} \left\| (\sum_i \eta_i z_i^4)^{1/2} \right\|_p \text{ (Khintchine)} \\ & \leq \frac{\sqrt{p}}{m} \left\| (\max_i \eta_i |z_i|) \left(\sum_i \eta_i z_i^2 \right)^{1/2} \right\|_p \\ & \leq \frac{\sqrt{p}}{m} \left\| \max_i \eta_i z_i^2 \right\|_p^{1/2} \left\| \left(\sum_i \eta_i z_i^2 \right)^{1/2} \right\|_p^{1/2} \\ & \leq \frac{\sqrt{p}}{m} \left\| \max_i \eta_i z_i^2 \right\|_p^{1/2} \left(\left\| \frac{1}{m} \sum_{i=1}^n \eta_i z_i^2 - 1 \right\|_p^{1/2} + 1 \right) \text{ (triangle inequality)} \end{aligned}$$

FFT-based Fast JL-Transform

$$\begin{aligned} \left\| \max_i \eta_i z_i^2 \right\|_p^{\frac{1}{2}} &\leq \left\| \max_i \eta_i z_i^2 \right\|_q^{\frac{1}{2}} \text{ for } q = \max(p, \log m) \\ \left\| \max_i \eta_i z_i^2 \right\|_q^{\frac{1}{2}} &= \mathbb{E}_{\alpha, \eta} \left[\max_i \eta_i z_i^{2q} \right]^{1/q} \leq \mathbb{E}_{\alpha, \eta} \left[\sum_i \eta_i z_i^{2q} \right]^{\frac{1}{q}} = \\ \sum_i \mathbb{E}_{\alpha, \eta} [\eta_i z_i^{2q}]^{\frac{1}{q}} &\leq (n \max_i \mathbb{E}_{\alpha, \eta} [\eta_i z_i^{2q}])^{\frac{1}{q}} \\ &= (n \max_i \mathbb{E}_\eta [\eta_i] \mathbb{E}_\alpha [z_i^{2q}])^{\frac{1}{q}} = (m \max_i \mathbb{E}_\alpha [z_i^{2q}])^{\frac{1}{q}} \\ &\leq 2 \max_i \|z_i^2\|_q^{\frac{1}{2}} (m^{\frac{1}{q}} \leq 2 \text{ by choice of } q) \\ &= 2 \max_i \|z_i\|_{2q}^2 \leq q \text{ (Khintchine)} \end{aligned}$$

FFT-based Fast JL-Transform

- Let $E = \left\| \left| \frac{1}{m} \sum_{i=1}^n \eta_i z_i^2 - 1 \right| \right\|_p^{\frac{1}{2}}$
- $E^2 - C \sqrt{\frac{pq}{m}} E - C \sqrt{\frac{pq}{m}} \leq 0$
- $E^2 \leq \max \left(\sqrt{\frac{pq}{m}}, \frac{pq}{m} \right)$
- Markov: $\Pr_{\Pi} \left[\left| \left\| \Pi x \right\|_2^2 - 1 \right| \geq \epsilon \right] \leq \epsilon^{-p} E^{2p} \leq \delta$
- $p = \log 1/\delta$ and $m \geq \frac{1}{\epsilon^2} \log \frac{1}{\delta} \log \frac{m}{\delta}$
